APPLICATION UPDATE FAILURE

OpenAI application package Error 0x80073D02

THE INCIDENT

Windows Reliability Monitor recorded two failed update attempts for an OpenAI application package. Microsoft Store reported that ChatGPT was in use. The user inspected processes, closed the relevant app, retried the update, and checked the installation result and subsequent application launch.

DEVICE	OPERATING SYSTEM
ASUS VivoBook	**Windows 11 Pro / 26H2**
JIRA INCIDENT	**INCIDENT DATE**
HDL-7	**November 6, 2026**

OBSERVED OUTCOME

Microsoft Store displayed the ChatGPT app among recent updates with an Open action. Reliability Monitor subsequently logged a successful update at about 1:08 PM. The Codex application launched and displayed its main interface without a visible error.

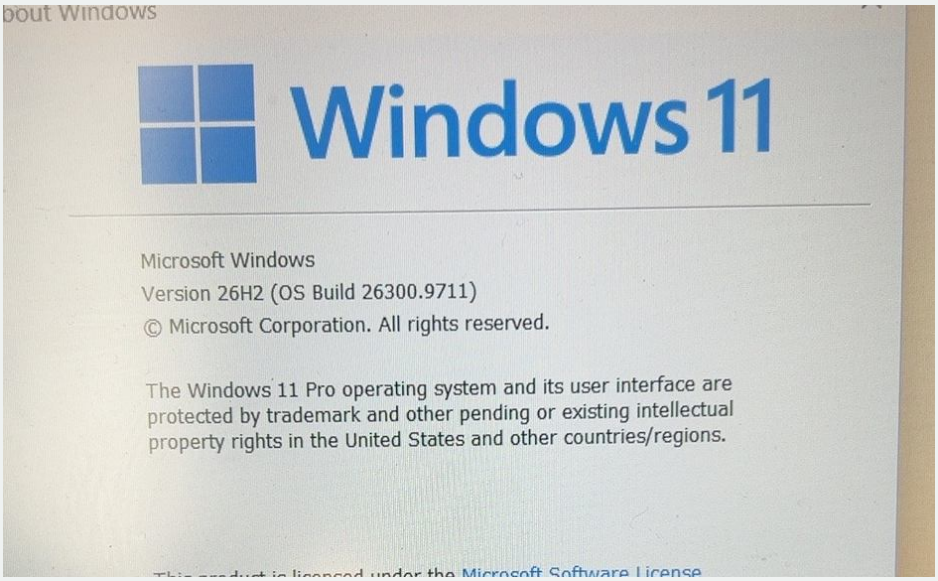

SCOPE OF VERIFICATION

Installation and initial launch verified; full app functionality not tested.

Evidence source: photos supplied in the conversation; no new screenshots were taken.

1 | Identify the failure

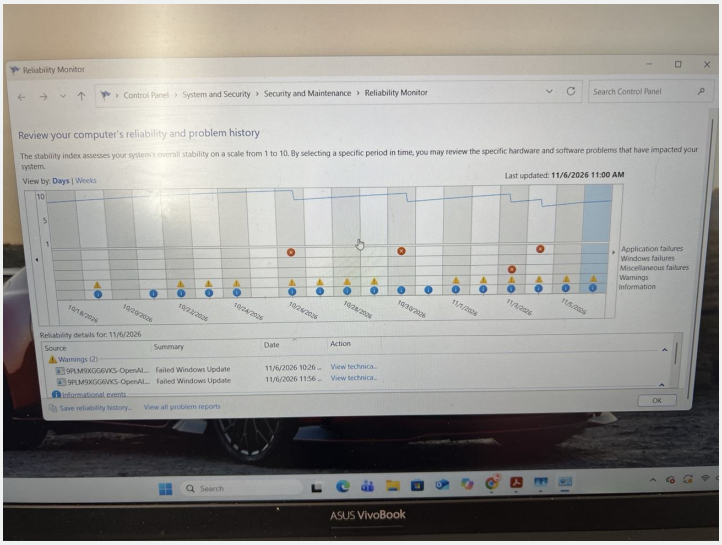

Record environment and application update diagnostics

Evidence A: Windows 11 Pro, version 26H2 and build 26300.9711.

INITIAL EVIDENCE

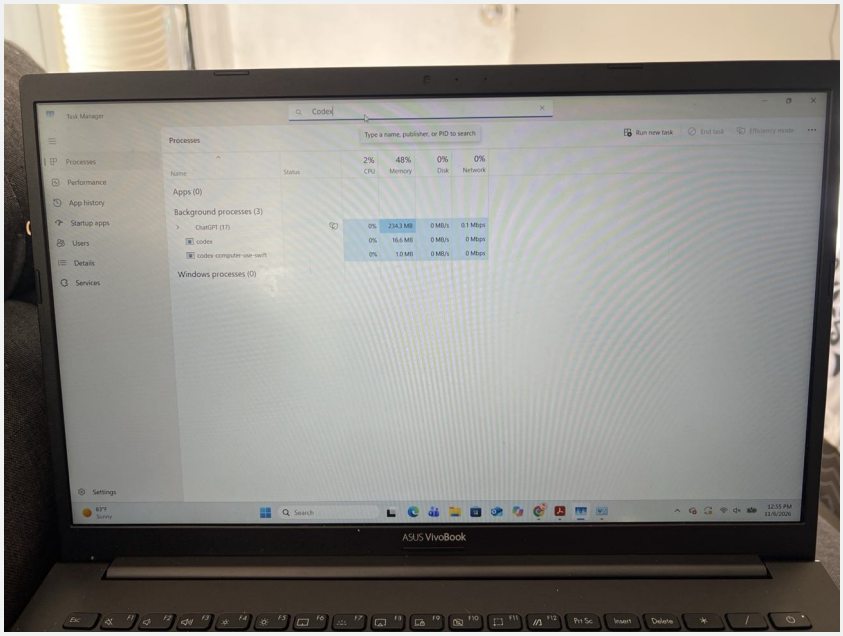

Reliability Monitor showed failed updates at approximately 10:26 AM and 11:56 AM.
A separate problem-detail view reported installation error 0x80073D02.
This error was treated as consistent with application resources being in use,
not proof of a conclusively determined root cause.

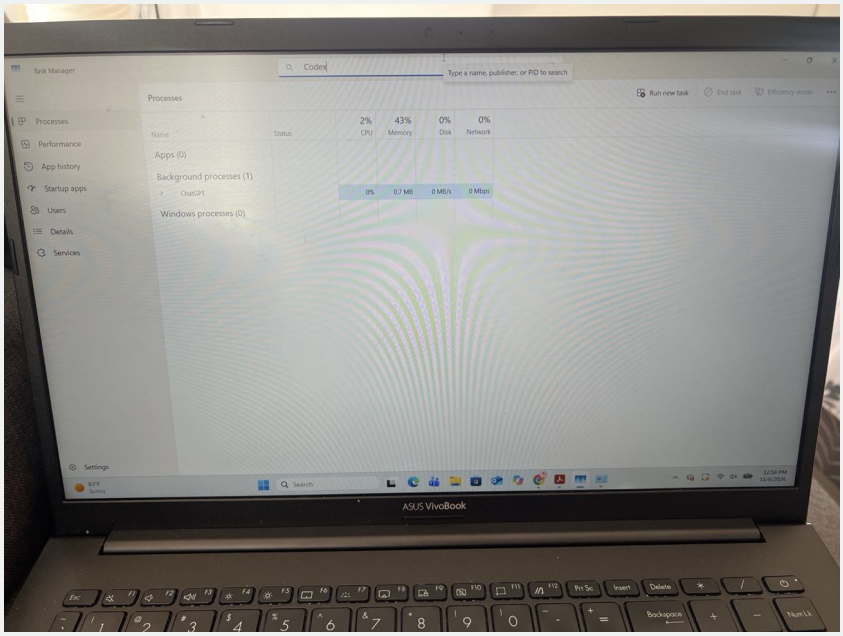

Evidence B: Reliability Monitor initially displayed two failed update warnings.

2 | Inspect background processes

Task Manager investigation before and after application closure

Evidence C: Task Manager lists ChatGPT, codex, and codex-computer-use-swift.

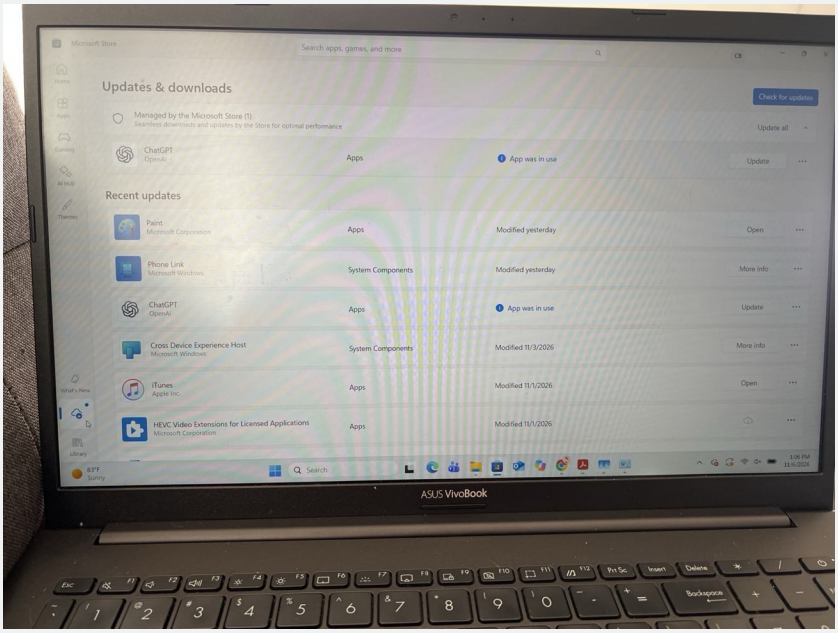

Evidence D: The separately listed Codex processes are no longer shown.

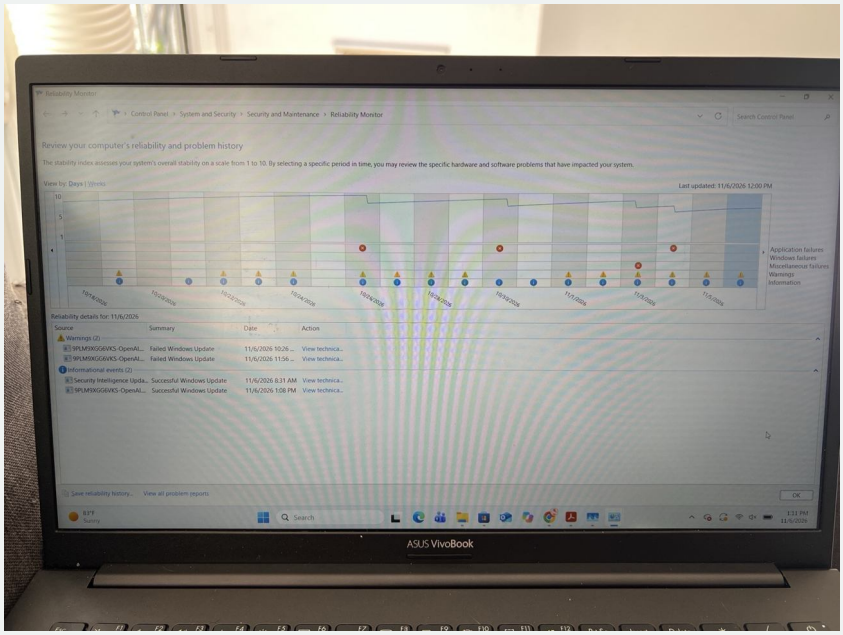

Interpretation: the process observations support closing interfering app processes; they do not establish that those processes were the sole cause of the error.

3 | Retry and review the update

Microsoft Store and Windows Reliability Monitor

Evidence E: Store displayed the message "App was in use" with an Update action.

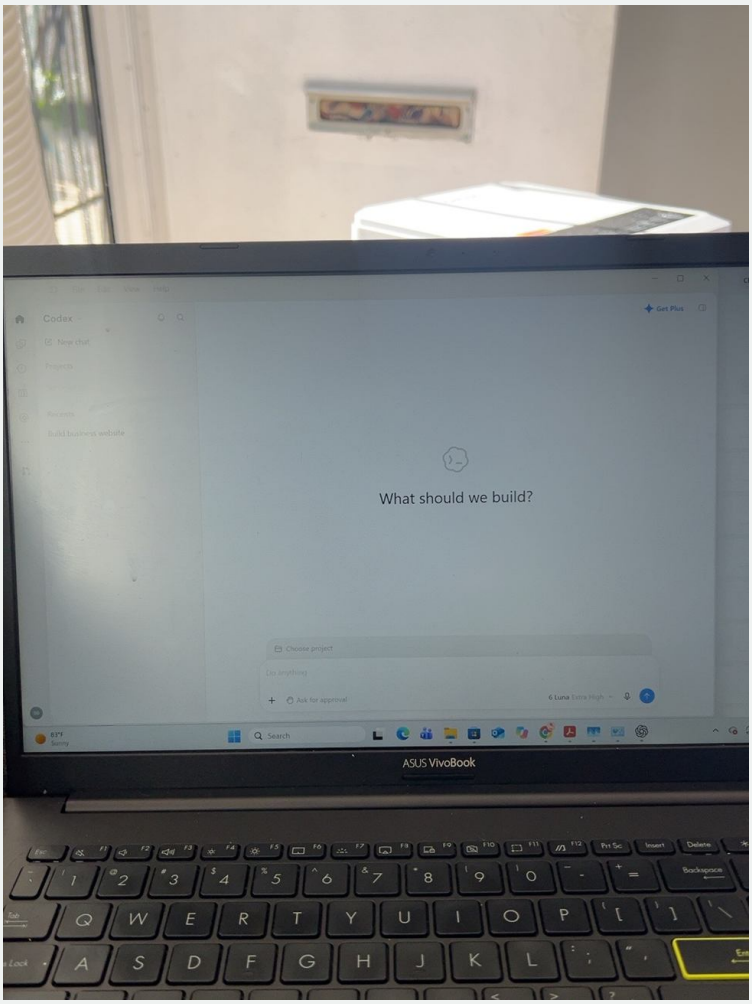

Evidence F: After retry, Reliability Monitor recorded a successful update at 1:08 PM.

Store separately showed ChatGPT in Recent updates with an Open action.

4 | Validate application launch

Post-update operational smoke test

Evidence G: OpenAI Codex main interface loads after the update retry.

VERIFICATION SUMMARY

Update installation: successful event recorded in Reliability Monitor.

Application launch: Codex opened and displayed its main interface.

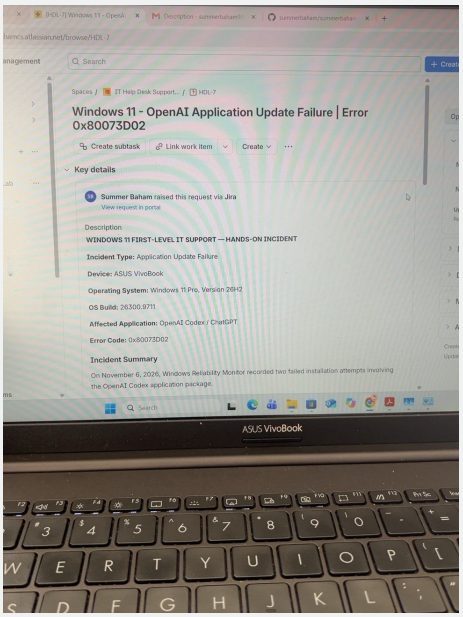

Visible startup error: none in the screenshot.

Limit: no complete function-by-function application test was performed.

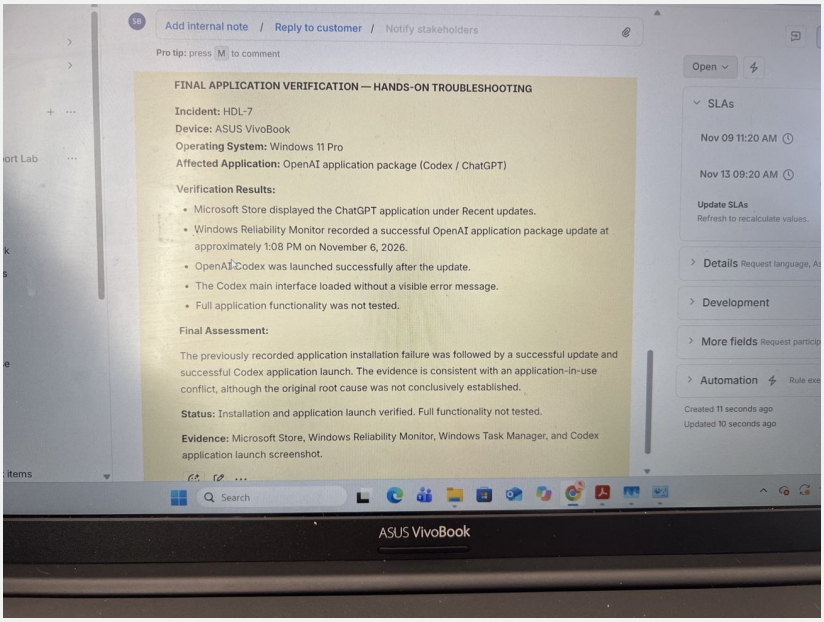

Finding: The update and initial launch were verified, not every feature.

5 | Document in Jira Service Management

HDL-7 records troubleshooting activities and verification

Evidence H: Jira HDL-7 includes the incident title, OS details, and error code.

Evidence I: Saved internal note documents the final verification and limits.

Training context: retrospective documentation of actual personal-device troubleshooting.

6 | Assessment and handoff

What the evidence demonstrates - and what it does not

COMPLETED WORKFLOW

1. Identified the Windows build and the affected OpenAI package.
2. Reviewed Reliability Monitor failure dates and error information.
3. Inspected active processes in Windows Task Manager.
4. Closed the app and observed the separately listed Codex processes disappear.
5. Checked Microsoft Store, retried the update, and reviewed the result.
6. Confirmed a successful update event and a successful Codex launch.
7. Created Jira HDL-7 and saved a final verification note.

FINAL INCIDENT ASSESSMENT

The evidence supports a successful application-package update and a successful subsequent launch. The earlier installation issue was consistent with a package resource or application-in-use conflict, but a definitive root cause was not proven. The lab demonstrates first-level Windows diagnostics and Jira ticket documentation.

LIMITATIONS / DISCLOSURES

- This was performed on a personal Windows 11 laptop, not in an enterprise tenant.
- Store app naming and the Codex package relationship are not independently verified.
- No admin account changes, production user support, or full software testing occurred.
- The screenshots were supplied via chat and may show photographed screens.
