TECHNICAL PORTFOLIO / HANDS-ON LAB

Jira Service Desk Queue Monitoring & KPI Dashboard

An evidence-based case study of simulated incident intake, saved JQL queries, workload visibility, and dashboard reporting in Jira Service Management.

SIMULATED TICKETS	SAVED FILTERS	DASHBOARD GADGETS
03	02	05

AUTHOR SUMMER BAHAM

CAPTURE DATE 05 NOV 2026

SIMULATED TRAINING ENVIRONMENT • NOT PRODUCTION INCIDENT DATA

Project overview

A compact, reproducible service desk monitoring lab built around three fictional IT support incidents.

This project used an **IT Help Desk Support Lab (HDL)** in Jira Service Management to model a small support queue. The work focused on recording incidents, checking their states, separating unresolved work with JQL, and making the data visible through reusable dashboard gadgets.

TOTAL TICKETS	UNRESOLVED	UNASSIGNED
3	2	1
100% of lab dataset	66.7% of all tickets	50% of unresolved

DELIVERABLE

HDL - Service Desk Queue Monitoring & KPI Dashboard, comprising two saved JQL filters and five dashboard gadgets.

SCOPE & METHOD

INCLUDED

- Ticket creation and categorization
- Triage and assignment visibility
- Saved filters and custom queue
- Status and assignment reporting
- Validated filter count metrics

NOT CLAIMED

- Real employees or production outages
- Completed VPN or Outlook diagnosis
- Actual SLA attainment or MTTR
- Live service remediation
- Measured operational performance

Evidence standard: All counts and workflow states below are grounded in the Jira screenshots captured on 05 Nov 2026.

Three simulated support cases

A small but varied queue was used to test status, assignee, and unresolved-work reporting.

HDL-4

Microsoft 365 Outlook email outage

Status: Work in progress | Assignee: Assigned to Summer | Priority: Medium

Approximately 12 employees across several departments; messages remained unsent and incoming mail was affected.

HDL-3

VPN authentication / remote access failure

Status: Open | Assignee: Unassigned | Priority: Medium

One remote employee could not reach internal resources; the stated internet connection was otherwise working.

HDL-1

Wi-Fi connectivity issue

Status: Resolved | Assignee: Assigned to Summer | Priority: Medium

An earlier simulated Wi-Fi help desk ticket; Jira shows the ticket in a resolved state.

TICKET-LIFECYCLE EVIDENCE

The screenshots demonstrate **ticket states and documented plans**, not end-to-end technical fixes. HDL-4 was assigned and moved to Work in progress. HDL-3 remained Open and unassigned. HDL-1 displayed Resolved. All three items showed Medium priority in the Jira results.

Saved filters and validation

Two independently saved searches drove the full-ticket and unresolved-ticket views.

FILTER 10001 / ALL SERVICE DESK TICKETS

```
project = HDL ORDER BY created DESC
```

Purpose: returns every ticket in the HDL project in newest-first order, including the resolved Wi-Fi ticket. Verified result: **3 tickets**.

FILTER 10002 / UNRESOLVED IT SUPPORT TICKETS

```
project = HDL AND statusCategory != Done ORDER BY created DESC
```

Purpose: excludes Done-category items. Verified result: **HDL-4 and HDL-3 (2 tickets)**, while HDL-1 was omitted.

TROUBLESHOOTING NOTE

An initial search using `resolution = Unresolved` still displayed HDL-1. Replacing that condition with `statusCategory != Done` returned the expected two open-work items.

SCREENSHOT EVIDENCE

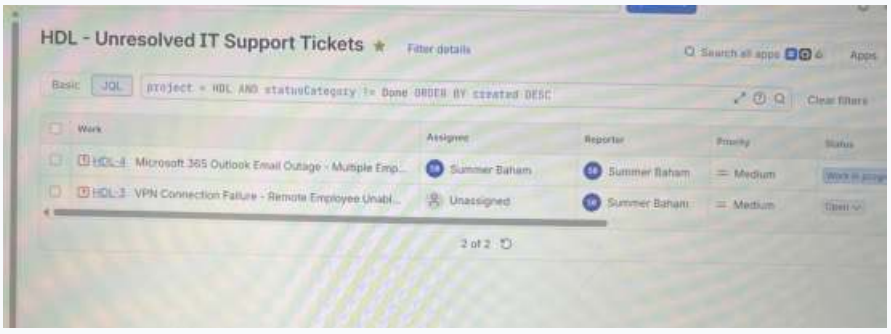

Figure 1. Saved unresolved filter shows exactly 2 matching work items.

Five working dashboard gadgets

The dashboard combined detailed ticket lists with counts and distribution views.

GADGET	DATA SOURCE	RESULT / DECISION SUPPORT
Filter counts	Unresolved filter	2 total unresolved; 1 unassigned
Filter Results	Unresolved filter	HDL-3 and HDL-4; active-work list
Filter Results	All-tickets filter	HDL-1, HDL-3 and HDL-4; full queue
Pie Chart - Assignee	All-tickets filter	2 assigned / 1 unassigned
Pie Chart - Status	All-tickets filter	1 Open / 1 In progress / 1 Resolved

FINAL DASHBOARD COMPONENTS

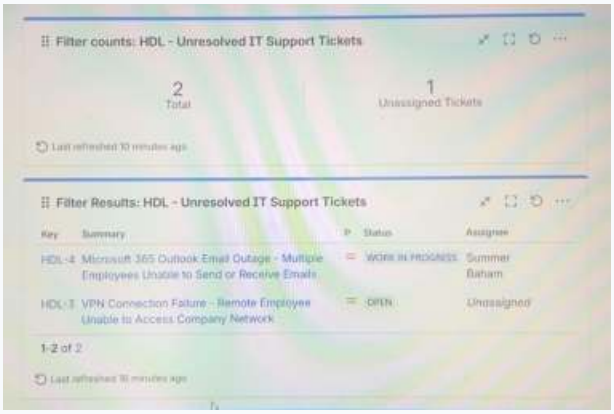

Figure 2. Working Filter Counts gadget and unresolved-ticket table after saving.

KPI evidence and interpretation

Observed Jira values are a point-in-time snapshot, not historical service desk performance.

Unresolved share 2 / 3

Resolved share 1 / 3

Unassigned within unresolved 1 / 2

STATUS & ASSIGNEE DISTRIBUTION

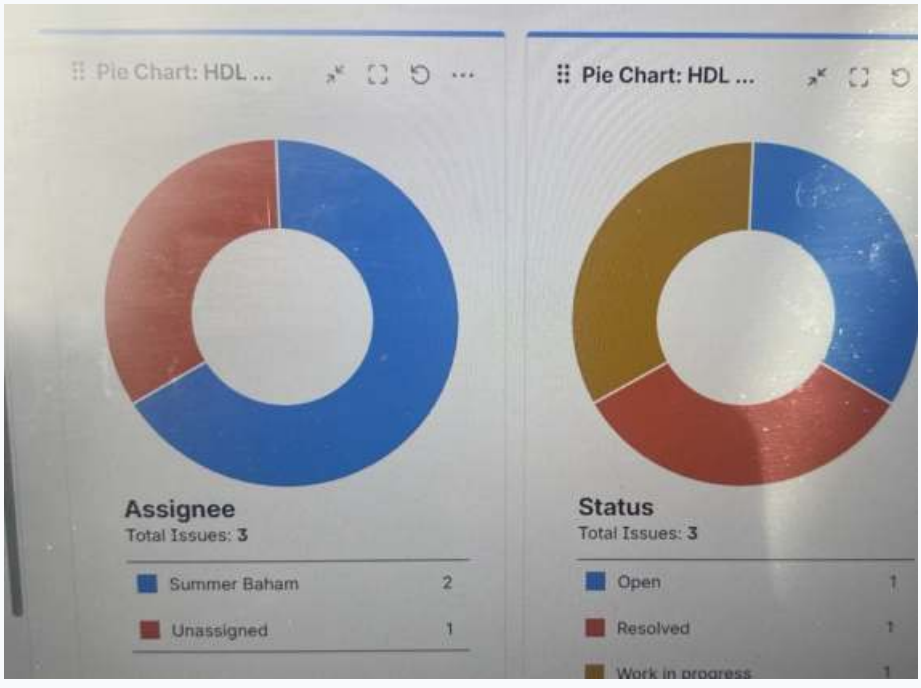

Figure 3. The original Pie Chart gadgets show the same three-ticket dataset by assignee and status.

Operational insight: the unresolved VPN ticket is the most immediate queue-triage candidate because it has no assignee.

Validation checklist

The lab was checked against the visible Jira records at the time of capture.

- All-tickets filter returned HDL-1, HDL-3, and HDL-4 (3 records).
- Unresolved filter returned HDL-3 and HDL-4 only (2 records).
- Filter Results columns displayed ticket key, summary, priority, status, and assignee.
- Pie Chart totals matched three tickets in both visualizations.
- Filter Counts returned Total = 2 and Unassigned Tickets = 1.
- Final dashboard layout provided full-width tables without excessive wrapping.

PRIMARY EVIDENCE / ALL-TICKET VIEW

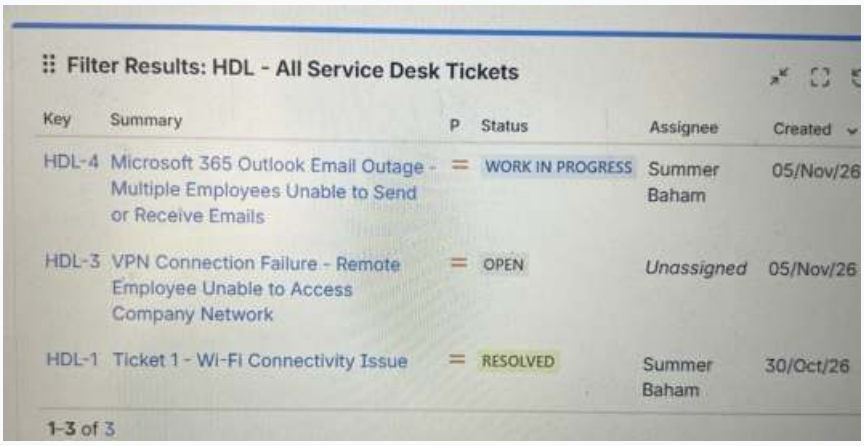

Figure 4. All-tickets Filter Results gadget listing HDL-4, HDL-3, and HDL-1.

Quality note: screenshots were cropped to foreground Jira content for readability. Numbers, labels, and ticket states were not modified.

07 / PORTFOLIO SUMMARY

Skills demonstrated & next steps

What this lab proves - and what further practice would add.

APPLIED SKILLS

Jira Service Management	Incident intake, field selection, queue navigation, and issue lifecycle tracking.
JQL	Building, testing, saving, and refining project-scoped filters.
Dashboard reporting	Configuring Pie Chart, Filter Results, and Filter Counts gadgets.
Triage & prioritization	Monitoring assigned vs unassigned work and identifying attention needed.
Documentation	Recording planned troubleshooting and capturing verifiable lab evidence.

LIMITATIONS / ACCURACY

This is a **simulated training lab**. The dataset is intentionally small. The documentation captures planned investigation steps, not executed VPN, Microsoft 365, or network troubleshooting. Ticket status is not proof of root-cause resolution. SLA response times, time to resolution, and real-world service outcomes were not validated.

RECOMMENDED NEXT ITERATION

1. Add several more synthetic tickets with varied priorities and assignees. **2.** Test a ticket escalation and document the outcome. **3.** Review why HDL-4 appears Medium priority despite the simulated high urgency and multi-user impact. **4.** Capture a clean non-editing dashboard view for the public portfolio.
